GTG-071 - compact silicone keyboard for industrial use and full functionality of a standard PC keyboard

Information ++ Presseinformation ++ Presseinformation ++ Presseinformation ++

Germering, 24th of April, 1998.

The GeBE Computer & Peripherie GmbH presents a new, compact silicone mat keyboard for industrial applications. The GTG-071 has 71 keys (inclusive Windows95 keys) and the full function of a standard PC keyboard.

There are the keys for operating the cursor and a separate numeric block. In addition the keyboard offers a special "block key" which switches between two levels of the keyboard.

The keyboard is available in different configurations:

- The silicon mat with German or US layout
- The fitting circuit board and inclusive keyboard controllers with RK and [PS/2](#) interface
- As 19 " 3HE front panel version
- Built into a sturdy metal housing as desktop device
- As built-in drawer for the installation behind a rectangular Cutout in any front panel.

The guidance of the keys by housing break-throughs, otherwise necessary with silicone mats, is replaced by a solid silicone rubber core. Thus the mat is easily integrable in a large rectangular break-through in the front panel. The keys are stabilized by additional burls under the key. As a consequence an outstanding tactile acknowledgement is achieved. The closed surface of the silicone mat enables the installation in applications where durability up to degree of protection of IP65 is requested.

The keyboard is suitable for devices, which require a compact, durable, dust and waterproof keyboard as well as the full functionality of a PC standard keyboard.
